

Factor Models: Understanding Return Drivers

Single Factor: CAPM

Return Decomposition by Factor

Factor Model Equations

FACTOR MODEL EQUATION

$$R_i = \alpha + \beta_1 F_1 + \beta_2 F_2 + \dots + \beta_k F_k + \varepsilon$$

Where:

- R_i = Return of asset i
- α = Unexplained return (skill)
- β_k = Sensitivity to factor k
- F_k = Return of factor k
- ε = Idiosyncratic noise

SINGLE FACTOR (CAPM):

$$R_i - R_f = \alpha + \beta(R_m - R_f) + \varepsilon$$

MULTI-FACTOR (Fama-French):

$$R_i - R_f = \alpha + \beta_1 MKT + \beta_2 SMB + \beta_3 HML + \varepsilon$$

Key Insight:

- Factors explain SYSTEMATIC return sources
- Alpha is the unexplained residual
- Good models have high R-sq and low alpha

Explained Variance by Model Complexity
