

# Factor Models: Understanding Return Drivers

**Single Factor: CAPM**

**Return Decomposition by Factor**

**Factor Model Equations**

## FACTOR MODEL EQUATION

$$R_i = \alpha + \beta_1 F_1 + \beta_2 F_2 + \dots + \beta_k F_k + \varepsilon$$

Where:

- $R_i$  = Return of asset  $i$
- alpha = Unexplained return (skill)
- beta\_k = Sensitivity to factor  $k$
- $F_k$  = Return of factor  $k$
- epsilon = Idiosyncratic noise

## SINGLE FACTOR (CAPM):

$$R_i - R_f = \alpha + \beta(R_m - R_f) + \varepsilon$$

## MULTI-FACTOR (Fama-French):

$$R_i - R_f = \alpha + \beta_1 MKT + \beta_2 SMB + \beta_3 HML + \varepsilon$$

## Key Insight:

- Factors explain SYSTEMATIC return sources
- Alpha is the unexplained residual
- Good models have high R-sq and low alpha

**Explained Variance by Model Complexity**
