

# Interpreting Regression Coefficients

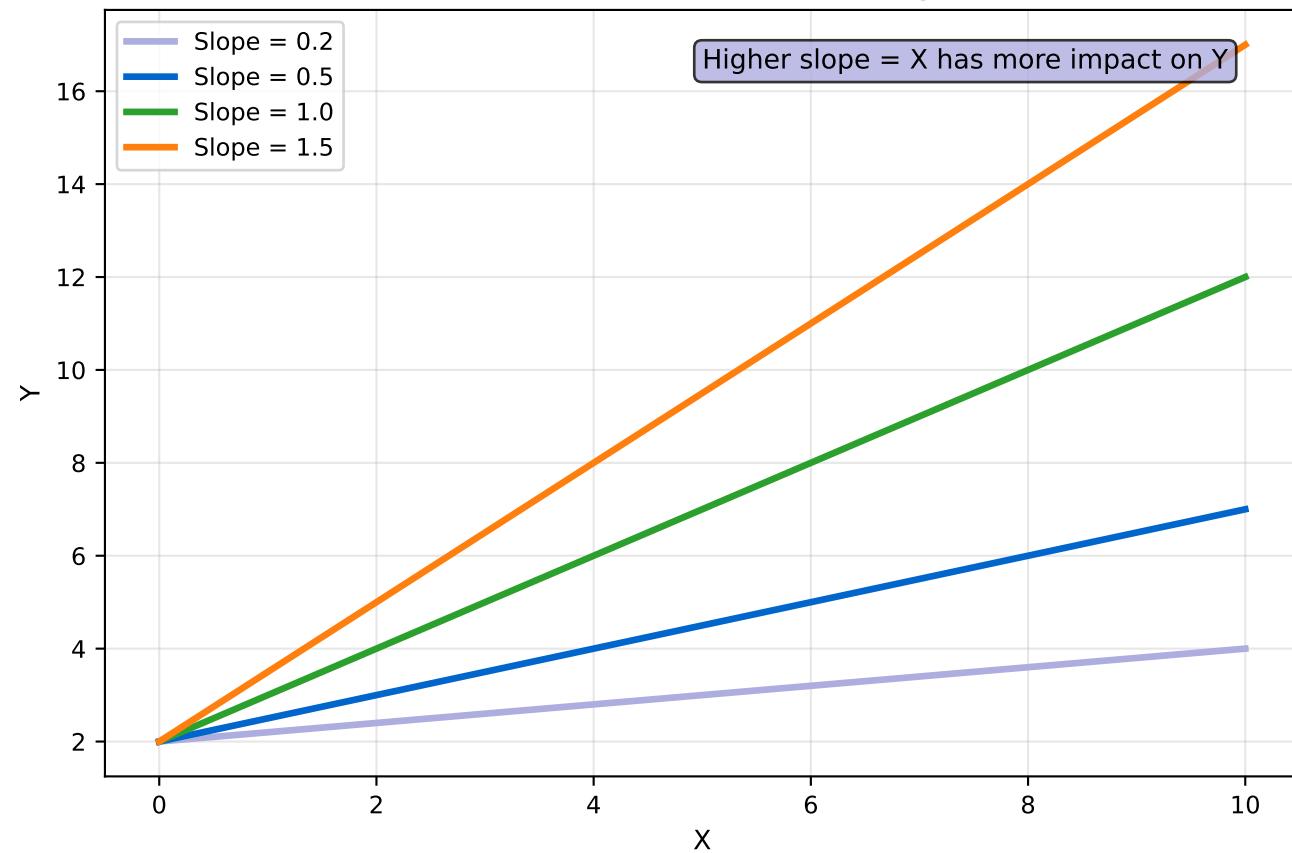

## Slope: Change in Y per Unit Change in X

## Intercept: Y Value When X = 0

## Slope Comparison: Steeper = Stronger Effect

## Finance Application: CAPM Beta

### FINANCE EXAMPLE: CAPM Regression

Model: Stock Return = alpha + beta \* Market Return

$$y = 0.5 + 1.2 * x$$

### Coefficient Interpretations:

#### INTERCEPT (alpha = 0.5%):

- Expected return when market return = 0
- Positive alpha: stock outperforms (risk-adjusted)
- Negative alpha: stock underperforms

#### SLOPE (beta = 1.2):

- For every 1% market move, stock moves 1.2%
- beta > 1: more volatile than market
- beta < 1: less volatile than market
- beta = 1: moves with market

#### Example Predictions:

- Market +5% -> Stock = 0.5 + 1.2(5) = +6.5%
- Market -3% -> Stock = 0.5 + 1.2(-3) = -3.1%
